

STROMPI 3

Productinformation Rev. 1.1

The revision 1.1 of the StromPi 3 can be recognized by the inscription "StromPi V3 Rev1.1" near the connector for the BatteryHAT and by the additional serialless jumper near the 40 pin GPIO connector.

In revision 1.1 the modifications, which had to be soldered in revision 1, have been incorporated into the PCB design. This means that **soldering is no longer necessary** for the PowerOn button function and for the serialless function.

The newly added serialless jumper connects the GPIO 21 (pin 40) of the Raspberry Pi to a GPIO of the microcontroller when set to "ON". The serialless function must still be activated as usual in the configuration of the StromPi 3.
